                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match
                            method. The method comprises obtaining a restriction fragment length polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating, amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments are useful to identify a wide range of Mycobacterium species, e.g. for diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate therapies, including M. tuberculosis, M. leprae and non-tuberculous mycobacteria (NTM) encountered in subjects infected
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  squamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing scarring such as keloid, adhesion and hypertrophic or hypertrophic burn scar. AAH57577 to AAH62099 represent sequences used in the
                                                                                                                                                                                                                                                                                                           ligonucleotide probes (AAS05227-AAS05242) that can be used to detect specific mycobacterial species. The probes are described in an invention relating to the use of rpoB gene fragments (AAS05201-AAS05224) from various Mycobacterial species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel PCR restriction fragment length polymorphism analysis (PRA)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Mycobacterium kansasii.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Non-tuberculous mycobacteria; rpoB gene fragment; NTM; HIV; PRA; RFLP; PCR-restriction fragment length polymorphism analysis; probe; 88.

RESULT 465
ABN84079/c
cengineered to contain 2 template annealing sequences, i.e. a
complate, e.g. mRNA encoding at least a portion of an antibody, and
cengiate, e.g. mRNA encoding at least a portion of an antibody, and
complate, e.g. mRNA encoding at least a portion of an antibody, and
complate, e.g. mRNA encoding at least a portion of an antibody, and
complate, encoding at least a portion of an antibody, and
complate, encoding at least a portion of an antibody, and
complate, encoding at least a portion of an antibody, and
complate encoding at least a portion of an antibody, and
complate encoding at least a portion site located
complate encoding sequence. The collar sequence is
complated to encoding and and
complated to encoding an encoding sequence (see ABN84080), their junction
complated to encoding an encoding sequence and esparated by a restriction digest to
complate a cleaved plasmid. The portion of the cleaved plasmid that
complated to the antibody constant region serves as a primer for
complated transcriptase to generate first strand cDNA. Transcription
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         გ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ននននន

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              terminates when the transcriptase encounters the upstream collar sequence of the cleaved plasmid in the antibody FR1 region. Ligation of the product then generates a plasmid vector containing a nucleic acid encoding the antibody light chain. The vector can be transformed into a host cell where it is converted to double-stranded DNA plasmids and amplified.
                                                                                                                     Novel sitosterolemia susceptibility gene polypeptide and polynucleotide, useful for screening a compound that increases the level of expression or activity of SSG polypeptide for treating

The invention relates to an isolated Sitosterolaemia Susceptibility Gene (SSG) polypeptide. SSG is a member of adenosine triphosphate (ATP) binding cassette (ABC) family cholesterol transporter. SSG is useful for identifying a compound useful in the treatment or prevention of a sterol-related disorder, including sitosterolaemia, hyperlipidaemia, hypercholesterolaemia, gall stones, HDL deficiency, atherosclerosis or hypercholesterolaemia, gall stones, HDL deficiency, atherosclerosis or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          other cardiovascular diseases, and sitosterolaemia-associated condition including archritis, xanthomas and chronic haemolytic anaemia. SSG expression cassette is useful in the production of transgenic non-human animals. SSG genes and their homologues are useful as tools for a number of applications including diagnosing sitosterolaemia and other cardiovascular disorders, for forensics and paternity determinations, and for treating any of a large number of SSG associated diseases. The present sequence is human SSG exon splice site.
                                                                                                                                                          The invention relates to a novel isolated molecule comprising bases 2-8 or 13-16 of 2 16 base pair sequences, or comprising a 1731 base pair sequence, all given in the specification or at least 95 % identity with the 1731 bp sequence. The nucleic acid molecule is useful in regulating apoptosis in cells and in drug screening. The method is useful in facilitating the induction of apoptosis in cells, in identifying an agen that can facilitate the induction of apoptosis in cells, and in inhibiting the growth of a cancer. This polynucleotide sequence represents a ribozyme binding substrate sequence relating to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             grug

                                                                                       Query Match
                                                                                                                                                patient previously diagnosed with a breast tumour and subsequently useful in determining the degree of aggressive treatment indicated. The prognostic method is especially useful in making decisions concerning treatment modalities, including therapeutic intervention, diagnostic criteria such as disease staging and disease monitoring and surveillance for metastasis or recurrence of neoplastic disease. The present sequence is a PCR primer used for LOH analysis. This primer is used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                          tumour re-occurrence in a patient previously diagnosed with a breast tumour. The method involves analysing the target cell sample for loss of heterozygesity (LOH) to chromosomal locus 3p24.3. The method is useful for determining the likelihood of tumour re-occurrence in a
